AUTHOR: Wanir, G. J., Magister + H

TITLE: Technical advance in the production of raw and roasted dolomite

PERIODICAL: Przegląd techniczny, no. 19, 1963, 7

TEXT: The technical progress in raw dolomite mines is based on the discovery and exploitation of raw dolomite with the most favorable chemical parameters, that is, with high concentration of CaCO_3 or $\text{CaMg}(\text{CO}_3)$ and a minimum of SiO_2 . Further progress is being achieved through the introduction of modern and more efficient equipment into existing processing plants and the construction of new, technologically more advanced, metallurgical plants. The chief advantages of modern metallurgical installations in all production stages are discussed. The increase of efficiency in most operations is exemplified by crushing and sorting of raw dolomite. Its output is expected to increase by 139.7% in 1965 as compared with 1962. Future improvements are anticipated, in particular with the view of eliminating certain operations now requiring human labor or which have to be carried out under particularly hazardous conditions. Such operations would be automated. Fully mechanized rotary kilns are to be introduced in the production of roasted dolomite raising the output by about one third with respect to non-mechanized kilns. The above pertains primarily to Huta im. Lenina and Huta Card 1/2/ im. B. Bieruta (Lenin and Bierut Foundations).

Effects of large doses of Na salicylate (5-7 g.) on respiratory volume, acid-base balance and oxygen saturation of the blood were studied in normal human subjects. Respiratory minute volume, venous oxygen saturation and metabolic rate all rose. It is concluded that salicylate causes relative hypoxia of the cells, which is compensated by general regulatory mechanisms.

TITLE: Proton spin lattice relaxation in liquid and vapor phase of hydrogen sulfide

SOURCE: Acta physica polonica, v. 28, n. 5, 1965, 673-679

TOPIC TAGS: spin lattice relaxation, hydrogen sulfide, relaxation time

ABSTRACT: Proton spin-lattice relaxation time T_1 in liquid H_2S and in a H_2S-D_2S mixture containing volume fraction 0.472 of H_2S were measured within the range of temperature from the melting point to the critical point and in the saturated vapor phase from 35C to 104C. In both, liquid T_1 increases at low temperatures and decreases at temperatures above zero C. The predominating role of dipolar relaxation in the liquid at low temperatures is demonstrated. In the saturated vapor phase the ratio of T_1 to density is found to be proportional to $T^{-4.2}$. The authors wish to express their thanks to Dr. J. S. Blicharski for many helpful discussions, to Dr. Janina Janik for preparing the pumice catalyst, and to Mr. S. Moroz for producing the glass apparatus. Orig. art. has: 2 figures and 5 formulas. Results of measurements of spin-lattice relaxation times in liquids obtained in the Kraków Lab. of Nuclear Magnetic Resonance. J. W. Hennel, A. Z. Hryniewicz, K. Krynicki, T. Waluga, and G. Zapalski (Polish Acad. Sci., Kraków). *AVT. ser. (Geneva) 11*, Spec. No., 243-6 (1968) (in English); cf. preceding abstr.—Results obtained for T_1 in purified H_2O and in $CHCl_3$ are 3.31 ± 0.07 and 60 ± 4 sec., resp. Values for $(\eta T_1)/T$, where η = viscosity, T = abs. temp., are not const. but decrease with increasing temp., particularly for $CHCl_3$. On the other hand, solns. contg. 2 or 10% gelatin give const. values for this ratio, where the value of η is for H_2O alone. James H. Pannell.

WALUGA, T.

19 6

Proton spin-lattice relaxation times in very dilute aqueous solutions of Ni^{++} and Mn^{++} ions. J. W. Hennel, K. Krynicki, T. Waluga, and O. Z. palaki. *Polish Acad. Sci. Inst. Nuclear Research, Rept. No. 124/CFJ*, 9 pp. (1960) (in English).—A curve $1/T_1 = (1/T_{10}) + k$ was found a good fit for proton spin-lattice relaxation time T_1 in aq. Ni^{++} solns. at concns. c from 2.38×10^{-4} to 5.6×10^{-4} Ni^{++} ion/cc., if $k = 1.02 \times 10^{-11}$ cc./l.m/sec. and the relaxation time in pure water $T_{10} = 3.1$ sec. In 1.19×10^{-4} and 1.33×10^{-4} Mn^{++} /cc. solns., T_1 was 1.97 and 1.92 sec., resp.; hence, k was 1.55×10^{-11} and 1.49×10^{-11} , in agreement with earlier data. Measurements of T_1 in the Ni^{++} (1.53×10^{-4} and 0.89×10^{-4}) and Mn^{++} (1.33×10^{-4} ion/cc.) solns. at temps. varying from 10 to 90° show the equation to hold over the temp. range under study. The T_{10}/T vs. T curves for the solns. at 10 to 90°, η being viscosity of water and T abs. temp., descended as the temp. rises.

Effect of varying fertilizer levels on yield and quality of the anthodia
of the flowers of the common chamomile, *Matricaria chamomilla*, L.
A. Wawut-Krogulska (*Prace Kom. Nauk. Farmac. polsk. Acad.*,
1952, 4, 257-275). The effect of N, P, and K on the yield and
anthodia quality of common chamomile was studied in pot and
field experiments. N fertilizer increased the total plant substance
and resulted in a higher yield of the flower anthodia and a higher
content of essential oil. P had no significant effect on the no. of
anthodia, but increased to a limited extent the no. of stalks. Small
amounts of K unfavourably affected the development of the plant;
increased levels resulted in increased amount of stem and roots.
A combination of all three nutrients had no effect on the flowering
time of the plant.

Title : The Effects of Woodknebs from the Birch Bark on Spontaneous Canine Tumors, Especially on Breast Tumors.

Orig Pub : Med. woteryn., 1955, 11, No 3, 148-151.

Abstract : Polyporus botulinus and Poria obliqua hydrolysates were administered to 2 dogs with spontaneous cancer of the breast resulting in a rapid improvement of their general health, thus permitting surgical intervention. Histologic changes in the tumor consisted of progressive necrosis of the cancer cells and in overgrowth of the connective tissue. These results were probably obtained because of a selective action of certain substances which were part of the hydrolysates used.

Title : Simple Method for Determining the Nature of Muscle Tissue
by Means of Paper Chromatography.

Orig Pub : Przem. spozywczy, 1956, 10, No 4, 171-172

Abstract : For determining the nature of meat a method has been worked out for analyzing the protein extract of muscle tissue by means of paper chromatography. 4 g of the muscle tissue under study are ground with 0.5 g of sand, 5 ml water are added and the mixture is filtered. 0.001 ml of the filtrate are placed on the paper (Whatman No 1 or No 4, 6 x 35 cm) at a distance of 6 cm from the edge, the paper is dried, kept for 3 hours in the vapors of the solvent (acetone - water 1:1, phosphate buffer pH 6.8- water 7:3,

Title : Treatment of Endogenic Eczema in Dogs by Injections of
a Peptone Solution.

Orig Pub : Med. weteryn., 1957, 13, No. 3, 153-158

Abstract : 10 dogs with chronic eczema were subcutaneously given 2-5
ml of a 20-30% solution of peptone through a day or
twice in a week. After the injection, there were ob-
served spasmodic contractions of the muscles, increased
temperatures of the body to 40°, sometimes shock pheno-
mena. Full recovery set in in 3-5 weeks. In one case,
a relapse of the illness was noted. Reasons for the
appearance of endogenic eczemas and methods of treatment
are discussed.

TITLE: Thermographic analysis of sodium perchlorate solutions

SOURCE: Zhurnal neorganicheskoy khimii, v. 11, no. 3, 1966, 673-675

TOPIC TAGS: phase diagram, perchlorate, sodium compound, thermographic analysis

ABSTRACT: The thermographic method was used to study the phase transformations in concentrated aqueous solutions of sodium perchlorate at low temperatures. The thermograms were recorded in temperature vs. time coordinates. Both polycrystalline samples (obtained by slow freezing) and vitreous samples were studied. In polycrystalline samples, the heating curves in the range of -196 to 0°C (77-273°K) showed only one endothermic transition at -38°C (235°K) (curve 1, Fig. 1). In vitreous samples, the heating curves showed two main transitions: an exothermic one (with a sharp temperature rise) at -78°C (195°K) and an endothermic one (with a distinct plateau) at 38°C (235°K) (curve 2, Fig. 1). The first transition corresponds to the devitrification of the solution, and the second is thought to be associated with the fusion of a eutectic mixture of the hypothetical composition $\text{NaClO}_4 \cdot 4\text{H}_2\text{O}$. A phase diagram of the aqueous sodium perchlorate solutions is shown in Fig. 2. Orig. art. has: 2 figures.

Title : Estimation of The Potential Barrier Height of Torsional Rotation in CH SH Molecules by Means of Slow Neutron Scattering

Orig. Pub: Bull. Acad. polon. sci., 1957, Cl. 3, 5, No 3, 295-297.

Abstract: An estimation of the potential barrier height of internal torsional rotation V_0 of the methyl mercaptan molecule CH_3SH was carried out by the method of thermal neutron scattering. The neutron source was 100 μ curie of Ra mixed with Be according to the reaction (α, n) . The effective cross section for the CH SH molecule ($\sigma_{\text{CH}_3\text{SH}} = 194.1 \pm 5$ barn), determined by the method of relative beam attenuation, was measured. Water was used as the standard liquid ($\sigma_{\text{H}_2\text{O}} = 91$ barn). The effective

cross section for the rigid CH_3SH molecule computed basing on Sachs and Teller theory $\sigma_{\text{rig}} = 258$ barn. Based on Kolos theory (in which the effective cross section is a function of the potential barrier height V_0), it was established that $\sigma_{\text{CH}_3\text{SH}} = 194.1$ barn and the potential barrier height V_0 - about 1000 kcal per mole for the measured cross section. Such a height agrees with results obtained by the methods of microwave spectroscopy, but disagrees with data obtained by the thermodynamic methods.

Klein formula for the active cross section of neutron scattering in an atom of a molecule as a function of the sample temperature, the geometric molecular structure and the neutron energy, the authors indicate the exhaustive calculations of Krieger and Melkin -- to prove their theory -- for the molecules CH_4 and H_2 and which established their agreement with E. Melkonian's experimentally obtained data in the field of energy. Similar calculations have been carried out in the Cracow Center for the molecule O_2H_4 , and the results compared with measurements made by Melkonian; as a result, an identical agreement has been established between experiments and theory (Ref. 3) J.A. Janik, Y. Maniawski, and H. Rianyi Acta Phys. Polon. 17, 489, 1958). In addition measurements have been made in the EDA-17, 489, 1958). In addition measurements have been made in the aluminum reactor with gas molecules of SH_2 (Fig. 2); in these an aluminum crystal was employed as neutron monochromator. Results obtained in this way conform fully with the Krieger-Melkin theory (Ref. 4) J.A. Janik, J. Janik, and A. Waniot Physica 26, 449, 1960).

On the scattering of ...

The results obtained by Melkonian on neutron scattering by water in a liquid state were compared with the Krieger-Jelkin theory for gaseous H_2O . Measurements of neutron scattering in H_2O and D_2O were also carried out with the use of crystal monochromators (Ref. 5). A. Tani: *Acta Phys. Polon.* 18, 255, 1959). The results obtained show a systematic increase of the active cross section as one passes from gases to liquids. These experimental facts can also be interpreted as answering the question, to what extent free molecular rotation is impossible in the fluid state. In the case of liquid water and ammonia, this determination is in agreement with the well known fact that the association in these liquids through hydrogen bonding is strengthened. In liquid hydrogen sulphide, for which there are inadequate physico-chemical data on hydrogen bonding evidence, the impossibility of free rotation is caused perhaps by a strong molecular packing. At the Gracow Center for Nuclear Physics, measurements have been made of the influence of molecular polarization, in which an easily polarizable liquid (in a crystal-fluid

state), namely so-called P-Azoxyanisole has been used in the magnetic field. (Ref. 6: J. Janik, S. Krańnicki, and A. Murasik: Acta Phys. Polon. 17, 483, 1958). The results of initial measurements have already been published (Ref. 6: Op.cit.) and further measurements are in progress. The main results are presented in Fig. 4. Experimental points and the curves drawn through them represent the percentage alteration in test transmission due to polarization of its molecules by a magnetic field, in relation to the decrease of polarization. This change is, as can be seen, a function of the energy of neutrons and indeed causes the neutron polarization of the sample; in the case of low energies a lowering and in the case of high energies a rise of neutron transmission occurs. This rela-

tionship can be explained to a semiquantitative degree on the basis of the Krieger-Selkin theory; it is necessary to assume here that the CH_3 groups at the end of the p-oxycyanisole molecule carry out a restricted rotational movement about the co-axis, while on the other hand the whole molecule carries out free rotation about the longitudinal axis. Where molecules have an oscillatory level in the energy region, one should expect a local maximum of the relationship between active cross sections and neutron scattering of the energy of these neutrons. This maximum should appear for the particular neutron energy which is necessary to create this oscillation level. Measurements have been made for liquid CH_3SH and, in fact, a local maximum of active cross section has been obtained where the level of oscillation of the internal restricted rotation was located. Measurements for gaseous CH_3SH are in progress; it can be already stated that in gaseous methylmercaptan there are two further local maxima in the vicinity of restricted rotation which could be shown as proof of the existence of levels of restricted rotation.
